AutoCAD Key Functionality AutoCAD's primary purpose is to support the drafting, design, and documentation of two-dimensional objects. It does not support three-dimensional modeling, computer-aided manufacturing, or other three-dimensional tasks. A key component of AutoCAD is the ability to import 3D files. Most AutoCAD users do not use the 3D functionality and few companies would use AutoCAD to design for 3D manufacturing. However, the ability to import 3D files and plot 3D elements and surfaces is a useful capability. Three-dimensional modeling can be traced back to the early days of the computer, when the software was called MODELM. CAD began in the 1980s as CAD-1, and it introduced basic three-dimensional modeling. AutoCAD continued that tradition, and it has been at the forefront of the evolution of CAD. As of April 2010, the latest release of AutoCAD is AutoCAD 2010. Importing 3D files Importing a 3D file into AutoCAD is similar to importing 2D drawings. There are two ways to do this. The most straightforward method is to do it manually. An alternative method is to use an import plug-in. To import a 3D file, use the Tools | Plug-ins menu. The Plug-ins Manager dialog box opens. Click the Import/Export | 3D Model from File... button to display the Import 3D Model from File dialog box. Step 1: Choose a file location The first step is to choose a location to save the 3D model. The Import 3D Model from File dialog box contains two radio buttons, where a default button in the lower-left corner applies the setting that was used when the plug-in was installed. To specify a file location for the 3D model, choose a location from the Add to Library drop-down list box. If you are using the default location, choose the default file location. Click OK to import the file. The Import 3D Model from File dialog box closes, and the file appears in the list of 3D files in the 3D Model List. You can customize the export settings for the imported 3D model. For more information about exporting a 3D model, see the article, "Export 3D Models." To delete the imported 3D model, right-click it in the list, and then select Delete

Geometric modeling In addition to the base functions present in most other CAD software, AutoCAD has a feature set for geometric modeling of solids and surfaces. The primary function is to define and edit solids, holes, and beams. Features include: Dynamic input and output format Functions include: adding and removing faces or edges; searching faces by criteria like face type, face name, or line type; searching edges by criteria like edge type, edge name, or line type; inserting edges or faces between faces; inserting new solids; rotating, mirroring, and scaling faces, edges, and solids; snapping; moving faces, edges, and solids; creating loft and infill points; generating faces; flipping faces; changing face attributes; rotating and moving beams; splicing and un-splicing faces; deleting faces and faces selected by other commands; creating faceted faces; cutting faces; editing and deleting edges; deleting edges selected by other commands; deleting beams; and applying mirror and scale transforms to faces. The user can model the edges of a 3D solid to form faces on the surface of that solid A beam object can be defined to span over other surfaces AutoCAD can create a loft surface from the edges of a 3D solid, when the edges are attached to the loft surface. The loft object has its own edit history. A "contouring" tool allows the user to place the contour lines on the object automatically in an editable list. Manually created surfaces and solids can be converted to a loft surface. Once a loft surface is created, it can be changed back to a manually-created surface or solid. A Beam insertion tool can be used to create and place beams on the surface of a 3D solid. A cut feature can be used to cut faces, edges or solids, as well as as-cuts. The cut features and functions are very similar to those found in other CAD programs, except for the auto-detect feature. The cut features can be used to create individual cuts, cuts through multiple objects, as well as a number of other cut options. Mathematical functions Functions include: algebraic functions, trigonometric functions, logarithmic functions, and arbitrary functions. A standard library of mathematical functions can be defined. These functions are similar to, but not identical to, those available in other CAD programs, such as Rhino. Other features 3D functions: the 5b5f913d15
