Download this free sample chapter from our book, Autodesk 3D Design 2019 CAD stands for computer-aided design. CAD programs are used to design products, buildings, machinery, and virtually any part of an object that would be built by a factory. CAD programs have many other uses, such as developing maps, publishing designs, and documenting projects. Download this free sample chapter from our book, Autodesk 3D Design 2019 Engineers, architects, and designers use CAD to create conceptual models of buildings and other large-scale projects. These models are referred to as blueprints, and are used as a reference to check the appearance and dimensions of a real-world object when it is being built. Using CAD for architectural design is possible because it provides a graphical interface to various design tools, such as point and line-based drawing tools and annotative drawing tools. Download this free sample chapter from our book, Autodesk 3D Design 2019 There are many types of CAD programs, and they can be used to create drawings with different features. Each program has a unique set of options and features that allow the designer to easily create a design or prototype that best fits their needs. Download this free sample chapter from our book, Autodesk 3D Design 2019 There are two types of CAD applications: desktop and mobile. Desktop CAD is a program that runs on a laptop or desktop computer that has the power to run a CAD program and perform other tasks. Mobile CAD is a program that runs on a tablet, laptop, or smartphone, and has the power to run the CAD program and perform other tasks. I would like to test a condition against all three substrings. For example: I have an input string with a specific substrings (separated by a ':' and of format A:X and B:X), and I would like to see if all three substrings are present in the input string. The problem is, I have to be able to handle up to 7 substrings that are separated by a ':' and of any length. For instance: A:AAA:XXX B:XXX C:XXX D:XXX E:XXX F:XXX (The strings can be separated by any amount of blanks, tabs, new lines, etc.) Given the above strings, I want to know if A is present, if X is present, if A and X are both present, if B is present, if C is present, if A, B and X are present, etc. My current solution is to use: String input = "AAA:XXX B:XXX C:XXX D:XXX E:XXX F:XXX"; List strings = new ArrayList(Arrays.asList(input
