Xy-pic

Xy-pic is a graphical representation package, written in TeX. It provides a way to draw diagrams and graphical objects, like nodes, edges, lines, surfaces, chains and graphs, for use in computer programs and in mathematics. Each kind of graphical object is drawn in a user-specified style, with user-specified colors, font and line widths. Thus you can draw any graphical object you want, and it will be visually consistent. It does not depend on the LaTeX or Metafont packages. Each kind of graphical object can be given a 'set of rules' for its shape, size, position, and orientation. For example, each kind of object can have a list of 'initial conditions', which describe how the object should be drawn initially. Also, you can provide a 'time function' for each kind of graphical object, which describes how the object should evolve over time. You can use arbitrary user-defined functions to define positions, sizes and colors, for example. Xy-pic Features: Xy-pic includes the following functions and features: Graphical Objects and Types: Xy-pic includes support for a rich set of graphical objects, such as nodes, edges, lines, surfaces, and chains. Each graphical object has a 'representation' which specifies how it is drawn and which attributes it has. Each graphical object also has a 'type', which indicates how it is used in a computation. The types available are: node, edge, chain, graph, line, surface, and cross-chain. Additionally, graphical objects can have additional information such as node positions, node colors, node styles, node size, and edge start and end positions. Xy-pic also provides a graphical representation for data structures in mathematics such as chain diagrams and lists of nodes. All graphical objects can be drawn with user-specified attributes, such as color, size, font, and line width. The user can also specify arbitrary user-defined functions to define positions, sizes and colors. Thus, it is possible to implement graphs in terms of arbitrary user-defined functions.
