uWall is a lightweight software utility that enables you to quickly encrypt and protect your removable devices, such as USB flash drives. In order to achieve this, all you have to do is connect the device to your computer and wait for it to be displayed inside the application. After that, the operation can be completed by following a very simple, step-by-step procedure. The conversion allows you to choose the disk type and size, as well as enter the desired password. Although the encryption is, in essence, what protects your documents, it can be quickly rendered useless if the chosen password is

weak, since it is used in the decryption process. Thus, you should use a more secure password, to make the encryption worthwhile. Create and mount virtual disks Beside external devices, uWall is also able to work with virtual disks, which allow you to keep the data secure on your computer as well. To do that, you can create virtual partitions on your hard disk and store the desired files into them, as well as apply the same encryption level as with the removable USB flash drives. In addition, in case you already have such virtual disks somewhere on your computer, the application enables you to open and mount them, in order to explore their contents and make use of the included documents. virtual disks for their removable devices. If you already have such disks somewhere on your computer, the utility allows you to access them and explore the content of them. In addition, the utility can protect your USB flash drives, CDs and DVDs, as well as portable hard disks with the help of a secure encryption algorithm. In order to counter pirates and reduce the occurrence of music file-sharing, the owner of a music file will often choose to secure it using a digital watermark. The content of such watermark will vary depending on the music and video file types. Although standard watermarks are often located in a part of the audio spectrum that humans are not able to hear, this is no longer necessary.

---

According to new researches, audio watermarks are as perceptible as those in movies and television. In a study published by the Royal Institute of Technology, Stockholm, a team of researchers have designed a watermark that is so unnoticeable that a human listener can only detect it when the signal is interrupted. As the inventors explain, the watermark is actually embedded in the spatial structures of the audio signals. Since the watermark is imperceptible, it will not affect the quality of the sound. This technology is an important step towards solving a major problem in the music industry, as it can help the owner of the copyright of a music file to stop the widespread piracy, as well as generate

---

revenue from music players, whose digital output signal is often modified or compromised. Do you have problems with the files on your flash drive? If so, perhaps your USB flash drive is faulty. Try using another flash drive, or use the information below to determine if the problem is related to the flash drive, or something else. Removable devices, such as USB flash drives, come in handy when you need to carry your data around and transfer it to other computers, due to the fact that they are usually very small and portable. The drawback is that anyone can have access to the information written on them, unless you protect the documents with a strong encryption algorithm.
