* Library: a library consists of a list of books, members and book rents. * Library table: the central database table that contains all data about the library. It contains 4 columns: id, catalog_id, member_id, item_id. * Member: a member must belong to a library. It consists of 3 columns: id, name and date_of_birth. * Book: a book is something that's been issued by a library (and a member is sure to own it at the end of his/her time as a member). It consists of 6 columns: id, name, book_publisher, year, edition, pages. * Rents: it contains the books that someone else owns (and this rental period's duration). It consists of 11 columns: id, library_id, member_id, date_rented, book_id, pages, ISBN, cost, period. Those are the essential datatypes of LibraryO. It's a PHP library that's designed to be "open" and "cross-platform" (The code is written in PHP and MySQL and it's licensed under GPL). I've been working on it for the past two years (during I've graduated from M.I.T.) and it's now released as open source. The release version is still in beta but it includes a large amount of features. Features: * an associative arrays view on the database tables: you can create datatypes that allow a library table to contain an array of info about a member (name, date_of_birth). * handles unlimited data tables and data rows (a library can consist of any number of books, member, rentals). * provides a PHP datatype to represent libraries. This datatype can be queried and iterated (the users of the library's tables can easily list all members, books, members who own a book with a certain ISBN or books belonging to a certain year). * provides an associative arrays view of all members of a library (a member can have 1 or more roles in a library). * provides an associative arrays view of all the books, members, rents belonging to a library. * generates tables and views for viewing data from any number of related data tables. * provides a number of classes to handle data tables (1 class for each of the library table's columns). These classes allow you to manipulate data tables in various ways (b7e8fdf5c8
