The use of high-throughput sequencing technology to generate large amounts of transcriptome sequences has allowed the identification of a number of transcripts with coding potential. It remains difficult, however, to assess their true function, as they are most likely uncharacterized genes. Although only a few experimental validations are available, RNAi- and over-

expression-based experiments provide strong evidences that the deletion of such genes may induce complex phenotypes that are difficult to interpret. To better understand the role of genes with unknown functions, their expression should be analyzed in a controlled manner to establish a correlation between the expression profile and the phenotype. This chapter is aimed at describing methods to construct and to sequence a cDNA library from an RNA extract derived from a specific experimental condition, such as a treatment or a genetic modification. In addition, the RNA-Seq analysis protocols are described in the context of differential expression studies, aimed at detecting genes that are differentially expressed between two experimental conditions or that have a significant impact on the phenotype. The chapter also describes how to perform a differential expression analysis on RNA-Seq data, providing a full tutorial on the software tools needed. The materials

and protocols are illustrated with the example of a whole animal study aimed at quantifying the expression of uncharacterized genes in the Mediterranean fruit fly. *Mictyris* *Mictyris* is a genus of moths of the family Noctuidae. It was first described by Moore in 1885.

Description Palpi usually lanceolate, reaching above end of Snout or slightly curved and smoothly scaled above. Third joint often fringed. Antennae with a slight decumbent tuft. Tibia dorsally clothed with long yellow hairs. Forewings with acute apical angle. Veins 2 and 1 present, while veins 3 and 4 are strongly defined. Hindwings with veins 3 and 4 from angle of cell. Species *Mictyris acuta* Hreblay & Ronkay, 1994 *Mictyris aegrota* (Püngeler, 1907) *Mictyris albicolor* Hreblay & Ronkay, 1994 *Mictyris angulifera* Kostyuchenko, 1987 *Mictyris aren*

Website: SmartFTP Client is intended for use as a client program. SmartFTP Server allows multiple clients to share resources over the network. This program is useful for network administrators or users that want to transfer files from one computer to another. Notice: SmartFTP Client requires a fast web connection to the Internet. When transferring large files, it is strongly recommended to use the Fast Transfer Protocol, or FTP, instead of the standard Transfer Protocol, or TFTP. The difference between these two different transfer protocols is explained below. If you wish to learn more about FTP, refer to the following links: - Using FTP as a Server - Using FTP as a Client " " " }]
