Netflix may be a big part of the cord-cutting crowd's entertainment bill, but their streaming service also isn't the cheapest around. Hulu, on the other hand, offers a no-frills subscription, \$7.99 a month, with some generous incentives if you sign up for a year early. Hulu's streaming video service is similar in some ways to the popular Netflix service, but there's one key difference: you can watch everything that Hulu has to offer for free as long as you're subscribed. Both have a relatively simple interface, both are major streaming video services, and both are accessible over the Internet. But since Hulu has a substantial library of TV content compared to Netflix's catalog, it's the clear favorite if you're after the most choices. Hulu requires a Hulu Plus

subscription to watch shows that aren't part of the free basic service. Netflix, meanwhile, is best for users who want a comprehensive selection of TV shows and movies, but there are some Hulu Plus shows that Netflix doesn't have. If you're looking to save some cash, but want access to everything Hulu has to offer, Hulu is the better choice. Both services have cost a pretty penny in the past. Netflix originally ran for \$8.99 a month, but has since been reduced to \$7.99, and at that price, there's still a catalog of titles that's relatively small compared to Hulu

The present invention relates generally to display systems for remotely located broadcasting equipment and more particularly to a composite video display system which facilitates the remote viewing and control of television broadcasting equipment through a high resolution image and a simplified control interface. Small portable television receivers have recently become popular, usually placed in vehicles such as automobiles, trucks and boats to provide a safe and convenient way to receive audio and video programs. For the purposes of this application the term receiver is intended to include both the apparatus itself and any associated sound or visual information processing equipment required to generate a reproduced image from an audio and/or video signal received at the receiver. More particularly, portable television receivers of the type previously disclosed have generally incorporated television receiver circuits which enable the receiver to be controlled from a remote location in the vehicle using a wired or wireless control interface. One common wireless system employs the use of a phased array antenna which is electronically steered to define a plurality of directional radio frequency (RF) beams as well as a global beam. In such a system a remote control transmitter is used to send a particular beam pattern corresponding to a selected program channel to the phase array antenna. The antenna radiates the RF signals which are received by the receiver. Currently available wireless systems use a standard RF control signal which occupies the frequency range from 400 to 500 MHz. A transmitter and receiver are used on opposite ends of the frequency range to alternately transmit and receive the control signal to control the receiver. The receiver monitors a separate carrier frequency and sequentially monitors the particular RF beam associated with a particular programming channel. The receiver demodulates the RF signals to extract the control information and then interprets the control information by recognizing a particular pattern of carrier pulses. The particular pattern of
